

# In need for High Resolution Seismics?

Let us do the job. Our CRSplus technology is capable of increasing the seismic resolution. Subtle details can be extracted from prestack seismic data. Plus high-res velocity models help detect high pressure zones.

Stacking velocity model before (left) and after (middle) CRSplus auto update. The difference plot (right) shows subtle structure-related details detected by the autoupdater.

The result is better details & more continuity on the data (middle vs. left) and an increased frequency content of up to 6 dB.
