

coh/TEEC®

Coherency Processing & Interpretation

Features

- ✓ Numerous processing operators
- ✓ Local dip and azimuth calculation
- ✓ Simultaneous multi-attribute display
- ✓ Fault attribute generator
- ✓ Interpretation module

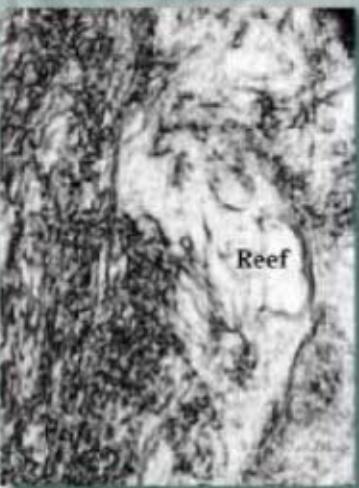

TEEC  **ware®**

Finest Software for
Seismic Reservoir Characterisation

CohTEEC is an ensemble of software and workflows which allows the mapping of lithology, fluid contacts and fractures. Multi-trace filters detect and map faults and fracture zones whereas subtle changes in seismic attributes are used to detect oil-gas-water contacts. The package uses pattern recognition and feature extraction algorithms to generate seismic volume attributes and process large 3D seismic surveys. The size of the segments and the number of traces can be varied depending on the studied problem.

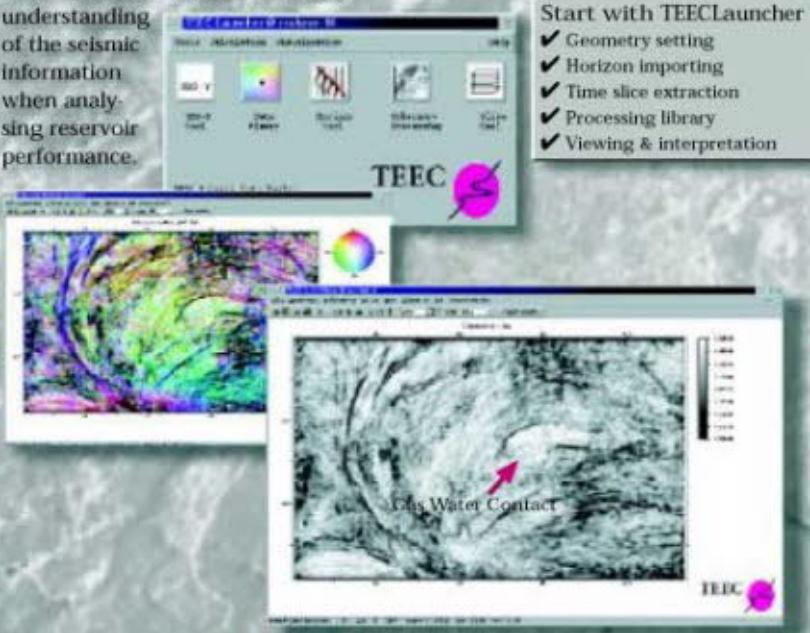

CohTEEC attributes have been used to identify features that are hard to detect or time consuming to interpret. In numerous cases these features have been linked to the reservoir heterogeneity. It has been shown that this information is essential for a better understanding of the seismic information when analysing reservoir performance.

Reef detection by CohTEEC

Start with TEECLauncher

- ✓ Geometry setting
- ✓ Horizon importing
- ✓ Time slice extraction
- ✓ Processing library
- ✓ Viewing & interpretation

Mapping GWC by CohTEEC

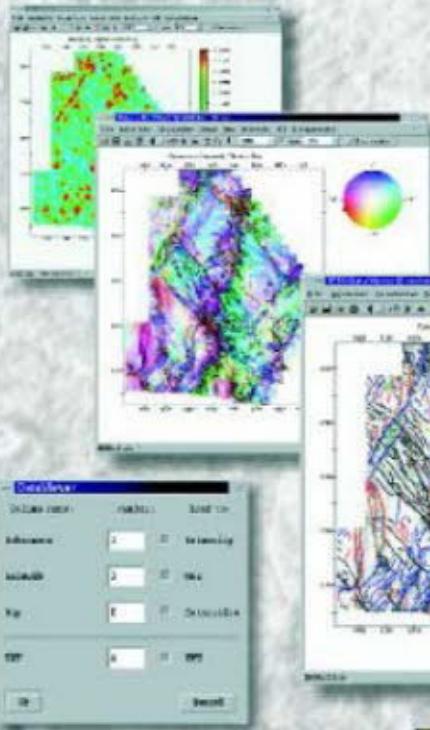

CohTEEC Coherency Processing

- ✓ Easy parameter setting
- ✓ Numerous 3D operators available
- ✓ Calculation of local dip & azimuth
- ✓ Suitable for multi-processor architectures

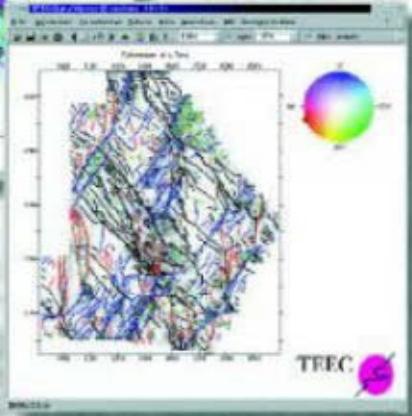

Interpretation Modules

DataViewer

- ✓ Viewing of coherency, dip & azimuth results using IHS color display
- ✓ Preparation of animations (slices, crosssections, IHS color code)
- ✓ Interpretation of lineaments & geological features
- ✓ Fault attribute generator
- ✓ Generating of maps showing fault density, connectivity etc.

TEEC

coh/TEEC®

Coherency Processing & Interpretation

CohTEEC in Summary

- ✓ SEGY & ASCII input & output
- ✓ Seismic data preparation & horizon loading
- ✓ Suitable for multi-processor architecture
- ✓ Coherency processing
- ✓ Choice of numerous operators
- ✓ Local dip & azimuth calculation
- ✓ Multi-attribute displaying & viewing
- ✓ Preparation of animations
- ✓ Unique interpretation module
- ✓ Detection & mapping of subtle faults or fractures
- ✓ Mapping of fluid contacts or lithology changes
- ✓ Digitizing & saving of geological features
- ✓ Fault attribute generator
- ✓ Preparing maps of fault density, connectivity or combinations
- ✓ Operating systems: Solaris, IRIX and LINUX
